

NAP Consistency

— How to Make Every Directory Work Together

Fix your listings once. Get found everywhere — from Google Maps to ChatGPT.

After this module: You'll have audited every major directory, fixed any inconsistencies in your Name, Address, and Phone number, and set up a system so your listings never drift again — giving AI search tools the verified data they need to confidently recommend you.

30+

Directories covered

7

Steps to clean listings

13%

Of AI visibility from citations

What you'll learn in this module

By the time you finish Module 3, you'll understand exactly why directory consistency matters for AI search — and you'll have done the work to fix it.

- 1 Why NAP consistency is a top-3 AI visibility factor**
The 2026 Whitespark study puts citations at 13% of AI search visibility. You'll understand exactly why, and why "close enough" is never good enough.
- 2 The exact match rules AI expects**
Why "123 Main St" and "123 Main Street" are two different signals in the eyes of an AI. The specific rules that determine whether your listings match or conflict.
- 3 How to audit your current listings in under an hour**
A step-by-step process to find every place your business appears online — and identify which ones need fixing.
- 4 How to fix inconsistent listings without losing your history**
The right order to fix things, how to claim unclaimed listings, and what to do when a directory won't let you edit.
- 5 The 30 directories that matter most for UK local AI visibility**
Not all directories are equal. A prioritised list of where to focus your time — tier 1, tier 2, and industry-specific.

Introduction: The Problem With Being Listed Everywhere (Inconsistently)

ANALOGY

Imagine you're trying to find a tradesman. You Google his name and find him on five different sites — but each one has a slightly different phone number, two have a different business name, and one has an address from when he worked out of his old premises. Would you trust that this is a real, reliable business? Or would you move on to someone whose details are consistent everywhere?

That's exactly the decision AI search tools are making about your business — multiple times a day. ChatGPT, Perplexity, Google AI Overviews, and Apple Maps all verify businesses by cross-referencing information across multiple sources. When your Name, Address, and Phone number are consistent everywhere, each matching source acts as a vote of confidence. When they conflict — even slightly — those conflicting signals make AI tools uncertain about recommending you.

The term for your Name, Address, and Phone number is **NAP**, and NAP consistency is one of the most impactful things you can fix for local AI search visibility.

Here's what makes this interesting: it's also one of the most overlooked. Most business owners set up their Google Business Profile years ago with one version of their details, then listed themselves on Yell with slightly different details, then got added to a couple of directories automatically with whatever details were scraped from their website at the time. Five years later they have a patchwork of inconsistent data scattered across the web — and they have no idea it's quietly undermining their ability to be found.

This module walks you through fixing all of it. It's genuinely one of the highest-return tasks you'll do all year — because unlike writing more content or building links, this is a one-time cleanup job that pays dividends permanently.

Section 1: Why NAP Consistency Matters More Than Ever in AI Search

How AI tools verify local businesses

When someone asks ChatGPT to recommend a local business, ChatGPT doesn't just pull your Google Business Profile and call it done. It cross-references multiple sources — your GBP, Bing Places, Yelp, industry directories, your own website, social media profiles — and looks for consistency. Each source that confirms the same name, address, and phone number increases its confidence that your business is real, active, and reliable. Each source that conflicts with the others reduces that confidence.

Think of it as the AI doing a background check. A confident recommendation requires passing that check. Inconsistent NAP data fails it.

The 2026 numbers that matter

The 2026 Whitespark Local Search Ranking Factors study confirmed that citations — the term SEOs use for directory listings that include your NAP — account for approximately 13% of AI search visibility. Three of the top five AI visibility factors are directly citation-related. This isn't a soft signal. It's a major, measurable factor in whether AI tools recommend you or pass you over.

KEY STAT

13% of your AI local search visibility comes from citations — how consistently your business information appears across directories and data sources. For most local businesses, this is one of the easiest 13% to fix.

Why "close enough" is never good enough

AI systems and Google's algorithm treat data matching as binary: either the signal confirms or it conflicts. There is no "close enough" category.

"Smith Electrical" and "Smith Electrical Ltd" are two different entities in a database. "07700 900000" and "+44 7700 900000" may look like the same number to you — they look different to a data parser. "123 High Street" and "123 High St" may refer to the same address, but systems that don't normalise data will treat them as two different addresses.

Section 2: The Exact Match Rules

Before you audit anything, you need to decide on your "canonical" NAP — the one true version of your business name, address, and phone number that will appear identically everywhere. Here are the rules:

Business Name rules

- ✓ Use your legal trading name consistently — not a shortened version on some platforms and the full version on others
- ✓ Include "Ltd", "Limited", or other legal suffixes only if they appear on your official registration. Don't add them on some platforms and omit them on others.
- ✓ Don't include your location in your business name unless it's legally part of your trading name. "Birmingham Plumbers" as a business name = fine if that's your trading name. "Smith Plumbing — Birmingham" = inconsistent keyword stuffing that can get GBP listings suspended.
- ✓ Capitalisation matters — pick a format and stick to it everywhere

Address rules

Use this	Not this	Why
123 High Street	123 High St	Abbreviations create conflicts
Birmingham, B1 1AA	Birmingham B1 1AA	Comma format must match
Unit 4, Acorn Business Park	Acorn Business Park, Unit 4	Order matters in address parsing
West Midlands	W. Midlands	No abbreviations in county

Phone number rules

- ✓ Pick one format and use it everywhere: either 01234 567890 or +44 1234 567890 — never mix them
- ✓ Use your main landline or business mobile consistently — not the mobile on some platforms and the office on others
- ✓ Don't use a call-tracking number on some directories and your real number on others

Section 3: The 30 Most Important Directories for UK Local AI Visibility

Not all directories are equal. Here they are in priority order — fix tier 1 first, then tier 2, then add yourself to any tier 3 that's relevant.

Tier 1 — Fix these first (critical for AI data)

Directory	Why it matters	URL
Google Business Profile	Primary AI citation source	business.google.com
Bing Places	ChatGPT uses Bing data	bingplaces.com
Apple Maps Connect	Siri + Apple AI	mapsconnect.apple.com
Yelp	Heavily used by AI tools	biz.yelp.co.uk
Facebook Business	Social proof + AI data	facebook.com/business
Yell.com	UK's primary consumer directory	yell.com

Tier 2 — Important supporting citations

Directory	Why it matters
Thomson Local	Long-established UK directory, AI-indexed
Hotfrog	Business citation aggregator
Foursquare / Swarm	Location data used by many AI apps
Scoot	UK B2B and consumer directory
Opendi	European directory with AI indexing
Cylex UK	Trusted local business citation
The Sun Business Directory	High domain authority UK citation
Brownbook	Global business listing, AI-indexed

Tier 3 — Industry-specific directories (pick what's relevant)

Directory	Best for
Checkatrade	Trades: plumbers, electricians, builders
TrustATrader	Trades and home services
Rated People	Home improvement trades
MyBuilder	Construction and renovation
Bark.com	Professional services, therapists, tutors
Treatwell	Hair, beauty, wellness
TripAdvisor	Hospitality, food, tourism
Booksy / Fresha	Salon, beauty
Rightmove / Zoopla	Estate agents, letting agents
NHS.uk	Healthcare providers
Solicitors Regulation Authority	Legal services
FCA Register	Financial services

PRO TIP

If you're in a regulated industry (legal, financial, medical, trades requiring certification), your regulator's directory is extremely high-trust for AI tools. Appearing in the FCA register, Gas Safe register, or SRA directory is worth more than dozens of generic directory listings.

A note on data aggregators

Behind the scenes, several companies collect business data from public sources and sell it to other directories. The biggest in the UK are **Acxiom**, **Experian**, and **Dun & Bradstreet**. If your data is wrong in these aggregators, it will spread incorrect information to dozens of directories automatically.

The way to fix this is to submit your correct details directly to each aggregator rather than trying to chase down every downstream directory. We'll cover this in Section 5.

Section 4: How to Audit Your Current Listings

ANALOGY

A NAP audit is like doing a stock-take. Before you can tidy up, you need to know what's actually out there. You might find things you listed yourself, things you didn't know about, and things with wrong information you never approved. You can't fix what you haven't found.

Step 1: Search for yourself

Open an incognito browser window (so your own browsing history doesn't affect results). Search for each of these:

- 1 Your exact business name in quotes: **"Smith Plumbing"**
- 2 Your phone number: **01234 567890**
- 3 Your address: **"123 High Street Birmingham"**
- 4 Your business name + location: **Smith Plumbing Birmingham**

Go through the first three pages of results for each search. Open every site where your business appears. Note down the URL and what NAP information they're showing.

Step 2: Use a free citation checker

BrightLocal offers a free citation audit tool (brightlocal.com/free-tools) that automatically searches 50+ directories for your business. It shows you which ones have you listed, what information they show, and flags inconsistencies. This saves a huge amount of manual work.

Alternatively, Moz Local and Whitespark both have citation audit tools (paid, but with free trials). For most small businesses, BrightLocal's free tool is sufficient for the initial audit.

Step 3: Create your audit spreadsheet

As you find listings, record them in a simple spreadsheet with columns: Directory URL, Business Name shown, Address shown, Phone shown, Status (Correct / Needs fixing / No listing). You'll use this to track what's been fixed and what still needs attention.

Step 4: What to look for in each listing

As you check each listing, look for these common issues:

Issue	Example	Fix needed?
Name abbreviation	"Smith Elec." vs "Smith Electrical"	Yes
Ltd suffix mismatch	"Smith Ltd" vs "Smith"	Yes
Old address	Previous premises still showing	Yes — urgent
Old phone number	Number you no longer use	Yes — urgent
Street abbreviation	"High St" vs "High Street"	Yes
Missing suite/unit	"123 Business Park" vs "Unit 4, 123 Business Park"	Yes
Exact match	All three fields match canonical NAP	No — leave it
No listing	Not on this directory at all	Add if tier 1/2

HEADS UP — THE MOST COMMON ISSUE

Old phone numbers are the most damaging inconsistency. If you changed your number two years ago but 15 directories still show the old one, AI tools have conflicting data on a crucial field. Old phone numbers are urgent — fix these before anything else.

Step 5: Prioritise what to fix first

You don't have to fix everything at once. Prioritise in this order:

- 1 Old phone numbers — anywhere an out-of-date number appears
- 2 Old addresses — especially if you've moved premises
- 3 Tier 1 directories with any inconsistency (GBP, Bing, Apple, Yelp, Facebook, Yell)
- 4 Tier 2 directories with name or address issues
- 5 Tier 3 and industry directories

Section 5: How to Fix Inconsistent Listings

ANALOGY

Fixing your directory listings is like correcting an address in your contacts app. You go into each one, find the wrong information, and replace it with the correct version. The only difference is there are more "contacts" to update — and some of them you didn't create yourself.

Claimed listings you control

For directories where you've previously created an account and claimed your listing, login and update the information directly. Most major directories — Google Business Profile, Bing Places, Yelp, Yell, Facebook — have straightforward edit interfaces.

If you've forgotten your login details, use the "forgot password" flow. You'll usually need access to the email address you originally signed up with. If you no longer have access to that email, most directories have a business verification process where they'll verify you're the owner via a postcard to your business address or a phone call.

Unclaimed listings you didn't create

Many directories automatically create listings using data scraped from other sources. You may find your business listed on sites you've never visited. The process to fix these:

- 1 Find the "claim this listing" or "is this your business?" link on the directory page
- 2 Complete the verification process — this usually involves confirming your name and business, then verifying via email or phone
- 3 Once claimed, update all three NAP fields to your canonical version
- 4 Add any other useful information while you're there — photos, description, website URL

PRO TIP

While you're fixing each listing, add your website URL if the directory supports it. This creates a citation that includes both consistent NAP data and a link back to your site — a stronger signal than NAP alone.

Listings you can't edit (and what to do)

Some directories don't have a simple claim process. They may require you to email a corrections team, submit a contact form, or in some cases pay for a "verified" listing. Here's the pragmatic approach:

- ✓ **For tier 1 and 2 directories** — it's worth the effort to contact them directly. Find their "report incorrect information" or "update business details" link, and submit a correction. Keep a record of when you submitted and follow up if nothing changes in 30 days.
- ✓ **For tier 3 directories** — if there's no easy way to edit, don't spend hours on it. Focus your time on directories that actually matter for AI citations.
- ✓ **For duplicate listings** — if the same business appears twice on one directory (common on GBP and Yelp), request a merge or flag the duplicate for removal. Duplicate listings create conflicting signals even if both have correct NAP.

Fixing data aggregators

As mentioned earlier, data aggregators distribute your business information to hundreds of downstream directories. Correcting your data at the aggregator level fixes many directories at once. The main UK-relevant aggregators:

Aggregator	How to update
Acxiom	acxiom.com/optout (data correction form)
Dun & Bradstreet	dnb.com/duns-number (submit your business)
Experian	Contact via business portal or email

HEADS UP

Aggregator corrections can take 4-8 weeks to propagate through to downstream directories. Don't expect overnight results — but the effort is worth it because one correction fixes many listings automatically.

Section 6: Adding New Citations Correctly

Once you've audited and fixed your existing listings, you'll probably find directories you're not on at all. Here's how to add new citations in a way that actually helps your AI visibility rather than creating new problems.

The right approach to new citations

- 1 Have your canonical NAP written down and ready to copy-paste.** Never type your business name, address, or phone number from memory when creating a new listing — you'll introduce inconsistencies. Paste from your master document every time.
- 2 Use a consistent email address for all directory accounts.** Create a dedicated email (e.g. `directories@yourbusiness.com`) so all the "verify your listing" emails go to one place and don't get lost.
- 3 Fill out every field the directory offers.** Description, website URL, business hours, categories, photos. A complete listing is a stronger citation than a bare-bones name-address-phone entry.
- 4 Choose the most accurate business category available.** If the directory has "Plumber" and "Emergency Plumber" as options, pick whichever describes you best. Don't pick a vague catch-all — specificity helps AI match you to specific searches.
- 5 Use exactly the same website URL everywhere.** Either with or without `www`, with or without a trailing slash — pick one and use it consistently. Ideally use the canonical URL from your Google Search Console settings.

PRO TIP — ADD PHOTOS

Directories that support photos get much better engagement — and Google's AI now reads photos to extract useful business information. When adding new listings, always upload at least 2-3 photos: your premises or van, a piece of completed work, and ideally a photo of yourself or your team. It takes 3 minutes and makes the listing significantly more useful to both AI tools and potential customers.

How many citations do you actually need?

There's a number bandied about in local SEO circles: "aim for 40-50 citations." That's a reasonable rough target but it's not the whole story. What matters more than the number is:

- ✓ **Quality over quantity** — 15 perfect citations on high-trust sites beats 80 sloppy ones on low-traffic directories
- ✓ **Consistency across all of them** — 40 citations with three different variations of your address is worse than 20 citations all perfectly consistent
- ✓ **Relevance** — an industry-specific directory is worth more than a generic one for AI recommendations in that industry

A practical target for most UK local businesses: the 6 tier 1 directories (all verified and perfect), 8-10 tier 2 directories, and 2-4 industry-specific directories relevant to your sector. That's 16-20 high-quality, consistent citations — which is genuinely competitive for most local markets.

HEADS UP — DON'T USE BULK CITATION SERVICES WITHOUT CHECKING

There are services that will submit your business to 50+ directories for £30-50. The problem: they often use slightly different formats for each directory, creating the inconsistency problem you're trying to fix. If you use one, check every listing they created before you consider the job done.

Your business website as a citation

Your own website is one of the most important citation sources for AI tools. Your contact page and footer should both show your canonical NAP — and they should match your GBP exactly. This sounds obvious but many businesses have a slightly different address format on their own website compared to their GBP. Check yours now and fix any discrepancy.

Section 7: Ongoing Maintenance — Keeping NAP Consistent as Your Business Changes

The work you've done in this module solves your existing inconsistency problem. But businesses change — you might move, change your phone number, rebrand, or open a second location. Here's how to keep your citations consistent going forward without it becoming a major project every time.

Set up a "listing update" document

Create a simple document (Google Doc, Notion page, or even a note on your phone) that includes:

- ✓ Your canonical NAP in full
- ✓ A list of every directory where you have a listing, with the login email and URL
- ✓ The last date you audited each one

When anything about your business changes — even a phone number — this document tells you exactly where to go and what to update. Without it, you'll forget about three directories and create the exact inconsistency problem you just spent time fixing.

Run a quick audit every 6 months

New directories launch, old ones disappear, and sometimes your listing information gets changed by the directory itself (it happens). A quick BrightLocal free check every 6 months takes 15 minutes and catches any drift before it becomes a problem.

If you're moving premises

This is when NAP consistency most commonly falls apart. Businesses update their GBP immediately, forget about Yell, and spend months with conflicting address information scattered across the web.

When you move:

- 1 Update your GBP and website first — these are the highest-priority sources
- 2 Work through your listing document and update every directory within one week of moving
- 3 Submit updated information to data aggregators immediately
- 4 Run a search audit 4 weeks later to catch anything you missed

Section 8: Your Website — The Most Important Citation Source of All

Your own website is often overlooked as a citation source, but it's one of the most trusted ones. AI tools give significant weight to your own website's content when verifying your business details — because it's the source you control, it should be the most accurate.

Where NAP should appear on your website

- ✓ **Footer** — your business name, address, and phone number should appear in the footer on every page. This is the single most important place for citation purposes.
- ✓ **Contact page** — your full canonical NAP, plus ideally a Google Map embed showing your location
- ✓ **About page** — mention your location and the areas you serve
- ✓ **Homepage** — at minimum, your phone number and location should appear above the fold

LocalBusiness Schema Markup — structured data that AI reads directly

Schema markup is code you add to your website that tells AI tools and search engines exactly what your business is, where it is, and what it does — in a structured, machine-readable format. For NAP consistency purposes, LocalBusiness schema is the most important type to add.

Here's what LocalBusiness schema looks like. You add this code to your website's header or footer:

```
<script type="application/ld+json">
{
  "@context": "https://schema.org",
  "@type": "LocalBusiness",
  "name": "Smith Electrical Ltd",
  "address": {
    "@type": "PostalAddress",
    "streetAddress": "123 High Street",
    "addressLocality": "Birmingham",
    "addressRegion": "West Midlands",
    "postalCode": "B1 1AA",
    "addressCountry": "GB"
  },
  "telephone": "01234 567890",
  "url": "https://www.smithelectrical.co.uk"
}
</script>
```

How to add LocalBusiness schema to your website

You don't need to be a developer to add schema markup. Here are the options from easiest to most involved:

- 1 If you have WordPress** — install the free Yoast SEO or RankMath plugin. Both have LocalBusiness schema built in. Fill in your business details in the plugin settings and it adds the code automatically to every page.
- 2 If you have Squarespace or Wix** — go to Settings → SEO → Structured Data. Both platforms now support basic LocalBusiness schema through their built-in SEO tools.
- 3 If you have a Shopify store** — install a free Schema app from the Shopify App Store, or add it via the theme liquid files if you're comfortable with that.
- 4 If you have a custom website** — paste the schema code (customised with your own details) into the <head> section of your homepage and contact page. Ask your web developer if you're not sure where to put it.

PRO TIP — TEST YOUR SCHEMA

After adding schema, test it at schema.org/SchemaApp or using Google's Rich Results Test (search.google.com/test/rich-results). Paste in your page URL and it will show you whether your schema is being read correctly and flag any errors. Takes 30 seconds.

Why schema markup matters for AI specifically

Schema markup is essentially you telling AI "here is my business name, exactly. Here is my address, exactly. Here is my phone number, exactly." It eliminates ambiguity. When AI tools crawl your website, structured data is the first thing they read — because it's designed to be machine-readable. A website with correct LocalBusiness schema is a much stronger citation than one without it, even if all the same information appears in the page text.

Section 9: The Seven Most Common NAP Mistakes (and How to Avoid Them)

After looking at hundreds of local business listings, the same mistakes come up again and again. Here they are so you don't make them:

Mistake 1: Different business names for different purposes

Using your trading name on Google and your legal name on Companies House is fine. Using "Bob's Plumbing" on your website, "Robert Smith Plumbing" on Yell, and "Bob Smith Heating & Plumbing" on Facebook is not. Pick one trading name and use it identically everywhere.

Mistake 2: Adding your location to your business name

"Smith Plumbing — Birmingham" on your GBP might seem like smart keyword placement. It's against Google's guidelines and it creates inconsistency because your actual business name doesn't include Birmingham. Use categories and your service area settings to signal your location — not your business name.

Mistake 3: Using a call-tracking number on some directories

Call tracking numbers are useful for measuring which directories drive calls. But if you use a tracking number on some directories and your real number on others, you have conflicting NAP. Either use tracking numbers everywhere or nowhere — not mixed.

Mistake 4: Forgetting to update listings when you change your number

This is the most common and most damaging mistake. When you get a new phone number, you update your GBP and your website. Then 18 months later you wonder why your AI visibility is poor — because 12 directories still have your old number.

Mistake 5: Creating multiple GBP listings for one business

Some businesses accidentally create duplicate GBP listings — perhaps when moving premises, or when setting up a new Google account. Duplicate listings split your reviews and send conflicting signals. Merge or delete duplicates immediately.

Mistake 6: Ignoring Apple Maps

Apple Maps is the default maps app on hundreds of millions of iPhones. Siri and Apple Intelligence use Apple Maps data. Many businesses have claimed their GBP and ignored Apple Maps Connect — meaning they're invisible to a significant chunk of mobile searches.

Mistake 7: Treating NAP consistency as a one-time job

You clean it up, it feels done, then two years later your phone number changes and the problem comes back. Build the quarterly audit habit and maintain your listing document. NAP consistency is a maintenance task, not a one-off.

Section 10: NAP for Businesses With Multiple Locations

If you have more than one premises or serve multiple areas, NAP consistency becomes more nuanced — but the principles are the same. Each location needs its own consistent NAP, its own GBP listing, and its own citations.

One GBP listing per physical location

Google allows (and encourages) a separate GBP listing for each physical location you operate from. Each listing should use the specific address for that location. Don't use the same address for two different locations, and don't list a residential address as a business premise if you don't have a physical office or shopfront there.

Service area businesses (SABs)

If you travel to customers rather than having a shopfront — a plumber, gardener, cleaner, or mobile dog groomer — you're a service area business. In GBP, set your service areas rather than displaying your home address. Displaying your home address on your GBP is a security risk and also creates citation inconsistencies (your website may list a different address than your GBP).

For SABs, your canonical NAP should include your business address only if it's a genuine business premises. Otherwise, use just your business name and phone number as your "consistent identifiers" across directories, with your service area specified separately.

ANALOGY

A SAB's NAP situation is like a consultant who works from a home office. They don't put their home address on their business cards — they put their name, number, and email. Same principle: your consistent identifiers are the things you're happy to publish everywhere.

Area pages on your website

If you serve multiple areas, create a dedicated page on your website for each area you serve: "Plumber in Birmingham," "Plumber in Solihull," "Plumber in Sutton Coldfield." Each page reinforces your presence in that location for AI tools without conflicting with your primary NAP.

Section 11: Measuring the Impact of Your Citation Cleanup

How do you know if all this work is making a difference? Here's what to track:

Google Business Profile Insights

Your GBP dashboard shows how many times your listing appeared in search results (impressions), how many people clicked through (website clicks), and how many called you directly from the listing (calls). Run a baseline now before you start the citation cleanup. Check again 6-8 weeks after completing it. You should see improvement in impressions and clicks as Google gets clearer, more consistent signals about your business.

Google Search Console

Search Console shows how often your website appears in Google results and what queries trigger it. After fixing citations and improving schema markup, you should see your local search impressions improve for location-based queries.

BrightLocal Citation Score

BrightLocal's free tool gives you a citation consistency score. Run it before you start the cleanup, then again 8 weeks later. A higher score = more consistent citations = stronger AI visibility signal.

The manual AI test

Every month, open ChatGPT and ask: "Recommend a [your business type] in [your town]." See if you appear. Ask Perplexity the same question. Check Google AI Overviews. Over time, as your citations improve, you should start appearing more frequently and being described more accurately when you do appear.

PRO TIP

Screenshot every AI test you run. Building a record of your progress over time is motivating and also genuinely useful — if you ever want to show a client or partner that your AI visibility has improved, you'll have the evidence.

Quick Wins Checklist

Work through these tasks over the next week. Tick each one as you complete it.

- ☐ Write down your canonical NAP in a document you can always refer to
- ☐ Check your Google Business Profile — confirm all fields exactly match your canonical NAP
- ☐ Check Bing Places — claim if not claimed, update NAP to match exactly
- ☐ Check Apple Maps Connect — claim and verify your listing
- ☐ Check Yelp — update NAP to match canonical version
- ☐ Check your Facebook Business page — confirm NAP matches
- ☐ Check Yell.com — claim or update to match canonical NAP
- ☐ Run BrightLocal free citation audit — note current score
- ☐ Fix any old phone numbers appearing on any directory — this is urgent
- ☐ Fix any old addresses still showing on any directory
- ☐ Check your own website footer and contact page — NAP must match GBP exactly
- ☐ Add or check LocalBusiness schema markup on your homepage
- ☐ Create your listing document — record every directory with login URL
- ☐ Set a calendar reminder to re-run the BrightLocal audit in 6 months
- ☐ Run a ChatGPT test: "Recommend a [your trade] in [your town]" — screenshot the result

What's Next

You've now completed three of the five modules in the Get Found in AI Local Search series. Here's where you stand:

- ✓ **Module 1** — You understand why local search is going AI and what changed ✓
- ✓ **Module 2** — Your Google Business Profile is fully optimised for the AI era ✓
- ✓ **Module 3** — Your NAP is consistent across all major directories ✓

In Module 4, we go deeper on reviews — specifically how to build a review strategy that works for both traditional Google ranking and AI search visibility.

COMING UP IN MODULE 4

Reviews That Actually Get You Found — and Chosen

Why review volume and recency matter more than ever for AI recommendations. How to write review response templates that serve as AI-readable content. The platforms beyond Google that AI tools check when evaluating your review reputation. And a 10-minute weekly system that keeps your reviews flowing without pestering customers.

Modules in this series are released daily during the week. If you bought this as part of the complete bundle, all five modules are available immediately. If you'd like the remaining modules individually, find them at aisearchschool.com.

Resources

Tools mentioned in this module

- ✓ **BrightLocal Free Citation Audit** — brightlocal.com/free-tools — run a free audit of your citations across 50+ directories
- ✓ **Google Rich Results Test** — search.google.com/test/rich-results — test your schema markup
- ✓ **Google Business Profile** — business.google.com — manage your GBP
- ✓ **Bing Places for Business** — bingplaces.com — claim your Bing listing
- ✓ **Apple Maps Connect** — mapsconnect.apple.com — claim your Apple Maps listing
- ✓ **Schema.org LocalBusiness reference** — schema.org/LocalBusiness — full documentation for LocalBusiness schema

Directories to check and claim

- ✓ **Yelp** — biz.yelp.co.uk
- ✓ **Yell** — yell.com
- ✓ **Thomson Local** — thomsonlocal.com
- ✓ **Hotfrog** — hotfrog.co.uk
- ✓ **Foursquare** — foursquare.com/businesses
- ✓ **Cylex UK** — cylex.co.uk
- ✓ **Brownbook** — brownbook.net

Where to go next

- ✓ **Module 4** (next in this series) — Reviews That Actually Get You Found — aisearchschool.com/guides
- ✓ **Free articles on AI search** — aisearchschool.com/articles
- ✓ **WeLaunchd** — get a properly structured website built for AI visibility — welaunchd.com

GET FOUND IN AI LOCAL SEARCH

The complete 5-module series

Everything a local business needs to be recommended by ChatGPT, Google AI, and every AI search tool your customers are using.

Module 1 — Why Local Search Is Going AI

Module 2 — Your GBP Set Up for the AI Era

Module 3 — NAP Consistency (you are here)

Module 4 — Reviews That Get You Found
